- Key Feature of IAM User
- Identity : An IAM user is essentially a named entity that AWS recognizes .Each IAM user is associated with an identity that can be used to sign in and access AWS resources.
- The permission Granted to the IAM user depends upon the policy attached to that user.However there are certain permission that IAM user cannot have by default
- The admin what he or she can do is provide IAM user different kind of permission

For Example, we have 4 people in our team Haley , alex , Luke and manny

What we can do is

The chief who is Claire

She can make Haley as administrative

Luke is working on EC2 so luke will be given permission to use EC2

Alex is also EC2

Now claire is out of town so if any new member joins the Team like manny

So manny will be given the permission by Haley

But still haley cannot see the payment information even though she is a administrative user

Only root user that is claire can see the information
